**Note:**

- Short-circuit protection works only for low-sides.
- The IPM does not shutdown IGBTs and output fault signal automatically when temperature rises excessively. When temperature exceeds the protective level that the user defined, the controller (MCU) should stop the IPM. Temperature of LVIC vs.  $V_{OT}$  output characteristics is described in Figure 3.
- When the LVIC temperature exceeds OT Trip temperature level ( $OT_T$ ), OT protection works and fault outputs.
- Fault signal  $F_O$  outputs when SC, UV or OT protection works.  $F_O$  pulse width is different for each protection mode. At SC failure,  $F_O$  pulse width is a fixed width (minimum  $20\mu\text{s}$ ), but at UV or OT failure,  $F_O$  outputs continuously until recovering from UV or OT state. (But minimum  $F_O$  pulse width is  $20\mu\text{s}$ ).
- The characteristics of bootstrap diode are described in Figure 2.

**Figure 2. Built-in Bootstrap Diode  $V_F$ - $I_F$  Characteristic (@ $T_a=25^\circ\text{C}$ ).**

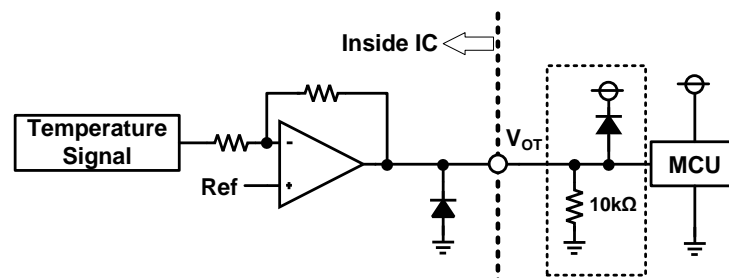

Figure 3. Temperature of LVIC vs.  $V_{OT}$  Output Characteristics.

- (1) Connect 10-k to  $V_{OT}$  pin if temperature monitoring function is used and leave the  $V_{OT}$  pin open (no connect) if not using temperature monitoring and use internal over-temperature shutdown function.
- (2) In the case of using  $V_{OT}$  with low voltage controller like 3.3V MCU,  $V_{OT}$  output might exceed control supply voltage 3.3V when temperature rises excessively. If system uses low voltage controller, it is recommended to insert a clamp diode between control supply of the controller and  $V_{OT}$  output for preventing over voltage destruction.

**Figure 9. Over-Temperature Protection (Low-side, Detecting LVIC temperature).**

- (10)  $V_{FO}$  output is open drain type. It should be pulled up to MCU or control power supply (e.g. 5V, 15V) by a resistor that makes  $I_{FO}$  up to 1mA. ( $I_{FO}$  is estimated roughly by the formula of control power supply voltage divided by pull-up resistor. In the case of pulled up to 5V, 10k $\Omega$  (over 5k $\Omega$ ) is recommended).
- (11) Thanks to build-in HVIC, direct coupling to MCU without any opto-coupler or transformer isolation is possible.
- (12) If high frequency noise superimposed to the control supply line, IC malfunction might happen and cause IPM erroneous operation. To avoid such problem, line ripple voltage should meet  $dV/dt \leq \pm 1V/\mu s$ ,  $V_{ripple} \leq 2V_{p-p}$ .
- (13) For IPM, it isn't recommended to drive same load by parallel connection with other phase IGBT or other IPM.
