Pin Configuration

Pin Description

Pin Number	Pin Name	Pin Function
1	AD0	Chip Address. The AD0 pin just connects to AOZ2235CQI-02 VCC pin or GND.
2	SCL	Clock I/O Terminal.
3	SDA	Data I/O Terminal.
4	VOI	Initial Output Voltage Feedback Input. Adjust the output voltage with a resistive voltage-divider between VCC and AGND.
5	VOUT	Output Voltage Feedback Input. Connection to output voltage.
6	AGND	Analog Ground.
7, 8, 9	IN	Supply Input. IN is the regulator input. All IN pins must be connected together.
10, 11, 16, 17, 18	LX	Switching Node.
12, 13, 14, 15	PGND	Power Ground.
19	EN	Enable Input. The AOZ2235CQI-02 is enabled when EN is pulled high. The device shuts down when EN is pulled low.
20	BST	Bootstrap Capacitor Connection. The AOZ2235CQI-02 includes an internal bootstrap diode. Connect an external capacitor between BST and LX as shown in Typical Application diagram.
21	VCC	Supply Input for Analog Functions. Bypass VCC to AGND with a 1 μ F~4.7 μ F ceramic capacitor, based on different PCB layout and application conditions. Place the capacitor close to VCC pin.
22	PGOOD	Power Good Signal Output. PGOOD is an open-drain output used to indicate the status of the output voltage. It is internally pulled low when the output voltage is 15% lower than the nominal regulation voltage or 20% higher than the nominal regulation voltage. PGOOD is pulled low during soft-start and shut down.

I²C Register Maps

Register Name	Register Address	Bit 7	Bit6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Output Voltage	00	Odd Parity	Output Voltage [6:0]						
Control A	01	Internal Mode			Output Voltage Change	PFMb			Protection Mode

Summary of Default Control Bits

Control Bit(s)	Default	Function
VOUT [6:0]	0110010	VOUT code, 7 bits VOUT [6:0]. Part default to 1.068750V.
Internal Mode	0 (External Mode)	0 case: External Mode 1 case: Internal Mode (1). If set to 1, the part switches to internal mode and VOUT register value controls output voltage. (2). The part can be set back to external control mode at any time by wiring this bit to 0.
Output Voltage Change	0	0 case: Internal protection on 1 case: Internal protection off (1). If set to 0, when VOUT code change, the internal protection isn't turned off. (2). If set to 1, when VOUT code change, the internal protection is turned off to avoid triggering internal protection.
PFMb	1	Select PFM or PWM at light load. 0 case: PFM 1 case: PWM Part defaults to PWM.
Protection Mode	1	Select Latch-off or Auto-recovery for protection. 0 case: Auto-recovery mode 1 case: Latch-off mode Part defaults to Latch-off mode.

Odd Parity Bit

The odd parity bit is set by the Master controller to be the exclusive-NOR of the output voltage [6:0] bits. It will be used by the AOZ2235CQI-02 to check that a valid data byte has been received. If odd parity is not equal to the exclusive-NOR of the output voltage [6:0] bits, the

AOZ2235CQI-02 assumes that an error has been occurred during the data transmission, and it will not send an ACK bit, nor will it reset the VOUT to the received code. (or, if the Control register will not reset the register contents as requested). The Master should try again to re-send the data. When reading back the VOUT register, the parity bit is sent back.
