Notes:

A. t_{pulse} < 1µs, f > 1Hz

B. Device can be operated at V_{GS}=0/15V. Actual operating VGS will depend on application specifics such as parasitic inductance and dV/dt but should not exceed maximum ratings.

C. The power dissipation P_D is based on $T_{J(MAX)}$=175°C, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

D. L=5mH, I_{AS}=8.5A, R_G=25Ω, Starting T_J=25°C.

E. The value of $R_{\theta JA}$ is measured with the device in a still air environment with T_A =25°C.

F. The $R_{\theta JA}$ is the sum of the thermal impedance from junction to case $R_{\theta JC}$ and case to ambient.

G. The value of $R_{\theta JC}$ is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of $T_{J(MAX)}$=175°C.

H. The static characteristics in Figures 1 to 8 are obtained using < 300µs pulses, duty cycle 0.5% max.

I. These curves are based on $R_{\theta JC}$ which is measured with the device mounted to a large heatsink, assuming a maximum junction temperature of $T_{J(MAX)}$=175°C. The SOA curve provides a single pulse rating.
