

Alpha & Omega Semiconductor Product Reliability Qualification Report

AOTL66912Q rev C

Plastic Encapsulated Device

ALPHA & OMEGA Semiconductor, Inc

www.aosmd.com

The report summarizes the AOS product reliability qualification results. Accelerated environmental tests are performed on a specific sample size and samples are electrically tested before and after each time point. Review of final electrical test results confirms that the product passes the AOS quality and reliability requirements based on **AEC-Q101** and may reference existing qualification results of similar products, which is justified by the structural similarity of the products. The released product will be categorized by its process family and routinely monitored for continuous improvement of product quality.

Test Item	Test Condition	Time Point	Total Sample Size	Number of Failures	Reference Standard

II. Reliability Evaluation

FIT rate (per billion): 2.61 MTTF = 43670 years

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size. Failure Rate Determination is based on JEDEC Standard JESD 85. FIT means one failure per billion hours.

At 60% Confidence Level Failure Rate = $Chi^2 \times 10^9 / [2 (N) (H) (Af)] = 2.61$ MTTF = $10^9 / FIT = 43670$ years

 $\begin{array}{l} \textbf{Chi}^2 = \text{Chi Squared Distribution, determined by the number of failures and confidence interval}\\ \textbf{N} = \text{Total Number of units from burn-in tests}\\ \textbf{H} = \text{Duration of burn-in testing}\\ \textbf{Af} = \text{Acceleration Factor from Test to Use Conditions} (Ea = 0.7\text{eV and } T_{use} = 55^{\circ}\text{C})\\ \text{Acceleration Factor } [\textbf{Af}] = \textbf{Exp} \left[\text{Ea} / \text{k} \left(1/T_{J} \text{ u} - 1/T_{J} \text{ s} \right) \right] \end{array}$

Acceleration Factor ratio list:

	55 deg C	70 deg C	85 deg C	100 deg C	125 deg C	150 deg C	175 deg C
