SEMICONDUCTOR

The AOS product reliability report summarizes the qualification results for AOZ13937DI-02 in DFN3x3-12L package. Accelerated environmental tests are performed on a specific sample size, samples are electrically tested before and after each stress time point. Review of final electrical test results confirm that AOZ13937DI-02 pass the AOS quality and reliability requirements. The released products will be categorized by its process family and routinely monitored for continuous improvement of product quality.

## I. Reliability Stress Test Summary and Results

| Test Item | Test Condition | Time Point | Sample Size / Lots | Number of Failures | Reference Standard |
| :---: | :---: | :---: | :---: | :---: | :---: |
| HTOL | $\begin{gathered} \mathrm{T}_{\mathrm{J}}=150^{\circ} \mathrm{C}, \\ \mathrm{~V}_{\mathrm{IN}}=32 \mathrm{~V} \end{gathered}$ | $\begin{aligned} & 168 / 500 / \\ & 1000 \text { hours } \end{aligned}$ | 231 pcs <br> (3 lots) | 0 | JESD22-A108 |
| Preconditioning (Note A) | $\mathrm{T}_{\mathrm{A}}=85^{\circ} \mathrm{C}, \mathrm{RH}=85 \%+$ 3 cycle reflow @ $260^{\circ} \mathrm{C}$ (MSL 1) | 168 hours | 924 pcs (3 lots) | 0 | JESD22-A113 |
| HAST | $\begin{gathered} \mathrm{T}_{\mathrm{A}}=130^{\circ} \mathrm{C}, \mathrm{RH}=85 \%, \\ \mathrm{P}=33.3 \mathrm{psia}, \\ \mathrm{~V}, \mathrm{IN}=32 \mathrm{~V} \end{gathered}$ | 96 hours | 231 pcs (3 lots) | 0 | JESD22-A110 |
| $\begin{gathered} \text { Pre-con + } \\ \text { PCT (autoclave) } \end{gathered}$ | $\begin{gathered} 121^{\circ} \mathrm{C}, 29.7 \text { psia } \\ \text { RH }=100 \% \end{gathered}$ | 96 hours | 231 pcs <br> (3 lots) | 0 | JESD22-A102 |
| Temperature Cycle | $\begin{gathered} \mathrm{T}_{\mathrm{A}}=-65^{\circ} \mathrm{C} \text { to } 150^{\circ} \mathrm{C}, \\ \text { air to air } \end{gathered}$ | 500 / 1000 cycles | 231 pcs <br> (3 lots) | 0 | JESD22-A104 |
| HTSL | $\mathrm{T}_{\mathrm{A}}=150^{\circ} \mathrm{C}$ | 1000 hours | 231 pcs <br> (3 lots) | 0 | JESD22-A103 |
| HTGB (MOSFET) | $\begin{gathered} \mathrm{T}_{\mathrm{J}}=150^{\circ} \mathrm{C}, \\ \mathrm{~V}_{\mathrm{GS}}=10 \mathrm{~V} \end{gathered}$ | $\begin{aligned} & 168 / 500 / \\ & 1000 \text { hours } \end{aligned}$ | $\begin{gathered} 231 \\ (3 \text { lots }) \end{gathered}$ | 0 | JESD22-A108 |
| HTRB (MOSFET) | $\begin{gathered} \mathrm{T}_{J}=150^{\circ} \mathrm{C}, \\ \mathrm{~V}_{\mathrm{DS}}=39 \mathrm{~V} \end{gathered}$ | $\begin{aligned} & 168 / 500 / \\ & 1000 \text { hours } \end{aligned}$ | $\begin{gathered} 231 \\ (3 \text { lots) } \end{gathered}$ | 0 | JESD22-A108 |
| Mechanical Shock | $\begin{gathered} \text { Condition B } \\ \mathrm{a}=1500 \mathrm{~g} ; \mathrm{t}=0.5 \mathrm{~ms} \end{gathered}$ | 5 shocks / side | $\begin{gathered} 30 \\ \text { (3 lots) } \end{gathered}$ | 0 | JESD22-B110B |

Note: The reliability data presents total of available generic data up to the published date.
Note A: MSL (Moisture Sensitivity Level) 1 based on J-STD-020

## II. Reliability Evaluation

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size of the product technology. Failure Rate Determination is based on JEDEC Standard JESD 85.

FIT rate (failures per billion device hours): $\mathbf{0 . 4 6 0}$
MTTF $=\mathbf{2 , 1 7 4 . 7}$ million hrs
The failure rate $(\lambda)$ is calculated as follows:
$\lambda=\chi^{2}[\mathrm{CL},(2 \mathrm{f}+2)] / 2 \times[1 /(\mathrm{SS} \times \mathrm{t} \times \mathrm{AF})]$; [equation 1] $\quad$ where $\quad \begin{array}{ll}\mathrm{CL} & =\% \text { of confidence level } \\ \mathrm{f} & =\text { number of failure } \\ \mathrm{SS} & =\text { sample size } \\ \mathrm{t} & =\text { stress time }\end{array}$
Looking up the $\chi^{2} / 2$ table for zero failure (burn-in) with $60 \%$ confidence, the value of $\chi^{2}[C L,(2 f+2)] / 2$ is 0.92 .

The Acceleration Factor (AF) is calculated from the following formula (both temperature and voltage acceleration factors are used in the final acceleration factor calculation) :
$A F=A F_{T} \times A F v=\exp \left[\left(E_{a} / k\right) \times\left(1 / T_{0}-1 / T_{s}\right)\right] \times \exp \left[\beta\left(V_{s}-V_{0}\right)\right]$ where
$E_{a}=$ activation energy
$k=$ Boltzmann constant
$T_{0}=$ operating $T_{J}$
$T_{s}=$ stress $T_{J}$
$V_{S}=$ stress voltage
$V_{0}=$ operating voltage
$\beta=$ voltage acceleration coefficient

Assuming typical operating environment, $\mathrm{V}_{\mathrm{o}}=25 \mathrm{~V}, \mathrm{~T}_{\mathrm{o}}=55^{\circ} \mathrm{C}, \mathrm{E}_{\mathrm{a}}=0.7 \mathrm{eV}, \mathrm{V}_{\mathrm{s}(\text { DriverlC) })}=28 \mathrm{~V}, \mathrm{~V}_{\mathrm{s}(\mathrm{MOSFET})}=30 \mathrm{~V}$, $\mathrm{T}_{\mathrm{s}}=150^{\circ} \mathrm{C}, \beta=0.5$ (silicon defect)

$$
\begin{aligned}
& A F(\text { DriverIC })=\exp \left[\left(\frac{0.7}{8.617 E-5}\right) \bullet\left(\frac{1}{273+55}-\frac{1}{273+150}\right)\right] \bullet \exp [0.5 \bullet(28 V-25 V)] \\
& A F(M O S F E T)=\exp \left[\left(\frac{0.7}{8.617 E-5}\right) \bullet\left(\frac{1}{273+55}-\frac{1}{273+150}\right)\right] \bullet \exp [0.5 \bullet(30 V-25 V)]
\end{aligned}
$$

Substituting the values in equation 1 , we have $\lambda=2 \bullet \lambda($ MOSFET $)+\lambda($ DriverIC $)=$
$0.92 \bullet \frac{2}{\text { Sample Size } \bullet \text { Stress Duration } \bullet A F(M O S F E T)}+\frac{1}{\text { sample Size } \bullet \text { Stress Duration } \bullet A F(\text { DriverIC })} h^{-1}$
$\lambda=0.46010^{-9} \mathrm{hr}^{-1}$ or 0.460 FIT; MTTF $=(1 / \lambda)=2,174.7$ million hrs $=248,251$ years
The calculation shows failure rate is 0.460 FIT, MTTF is $2,174.7$ million hours under typical operating conditions.

## ELECTROSTATIC DISCHARGE, LATCH UP

## TEST REPORT

Part Number: AOZ13937DI-02
Package: DFN3x3_12L

| ESD, LATCH UP RESULTS |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Test | Specification | Conditions | Temperature | Sample <br> Size | Results $^{(2)}$ |
| Electrostatic <br> Discharge | JESD-A114 | $\pm 2.5 \mathrm{kV}(\mathrm{HBM})$ | 25 C | 3 | PASS |
| Electrostatic <br> Discharge | JESD-C101 | $\pm 1 \mathrm{kV}(\mathrm{CDM})$ | 25 C | 3 | PASS $^{\text {Jatch Up }}$ |
| JESD78 | $\pm 100 \mathrm{~mA}, 1.5 \mathrm{x} \mathrm{OV}$ | 25 C | 6 | PASS $^{(1)}$ |  |
| Latch Up | JESD78 | $\pm 100 \mathrm{~mA}, 1.5 \mathrm{x}$ OV | 125 C | 6 | PASS $^{(1)}$ |

Note:

1. CAP pin Current Inject $\pm 20 \mathrm{~mA}$ and FLTB pin Current Inject $\pm 50 \mathrm{~mA}$, Immunity Level B
2. ATE results are used to determine PASS/FAIL. Parametric shift $<10 \%$.

## Pin Configuration
