V. Reliability Evaluation

The presentation of FIT rate for the individual product reliability is restricted by the actual burn-in sample size of the product. Failure Rate Determination is based on JEDEC Standard JESD 85. FIT means one failure per billion hours.

FIT rate (failures per billion device hours): 0.150

MTTF = 6,649.6 million hrs

Condition: $V_o = 20V$, $T_o = 55^\circ C$, $V_{s(DriverIC)} = 28V$, $V_{s(MOSFET)} = 25V$ and $T_s = 150^\circ C$

Sample Size: MOSFET = 6,153, Driver IC = 3,874

The failure rate (λ) is calculated as follows:

$$\lambda = \chi^2 [CL, (2f+2)] / 2 \times [1 / (SS \times t \times AF)]; \text{ [equation 1]} \quad \text{where} \quad \begin{array}{l} CL = \% \text{ of confidence level} \\ f = \text{number of failure} \\ SS = \text{sample size} \\ t = \text{stress time} \end{array}$$

Looking up the $\chi^2/2$ table for zero failure (burn-in) with 60% confidence, the value of $\chi^2 [CL, (2f+2)] / 2$ is 0.92.

The Acceleration Factor (AF) is calculated from the following formula (both temperature and voltage acceleration factors are used in the final acceleration factor calculation) :

$$AF = AF_T \times AF_V = \exp[(E_a/k) \times (1/T_o - 1/T_s)] \times \exp[\beta (V_s - V_o)] \quad \text{where} \quad \begin{array}{l} E_a = \text{activation energy} \\ k = \text{Boltzmann constant} \\ T_o = \text{operating } T_j \\ T_s = \text{stress } T_j \\ V_s = \text{stress voltage} \\ V_o = \text{operating voltage} \\ \beta = \text{voltage acceleration coefficient} \end{array}$$

Assuming typical operating environment, $V_o = 20V$, $T_o = 55^\circ C$, $E_a = 0.7eV$, $V_{s(DriverIC)} = 28V$, $V_{s(MOSFET)} = 25V$, $T_s = 150^\circ C$, $\beta = 0.5$ (silicon defect)

$$AF(DriverIC) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (28V - 20V)]$$

$$AF(MOSFET) = \exp\left[\left(\frac{0.7}{8.617E-5}\right) \cdot \left(\frac{1}{273+55} - \frac{1}{273+150}\right)\right] \cdot \exp[0.5 \cdot (25V - 20V)]$$

Substituting the values in equation 1, we have $\lambda = 2 \cdot \lambda(MOSFET) + \lambda(DriverIC) =$

$$0.92 \cdot \frac{2}{\text{Sample Size} \cdot \text{Stress Duration} \cdot AF(MOSFET)} + \frac{1}{\text{sample Size} \cdot \text{Stress Duration} \cdot AF(DriverIC)} \text{ hr}^{-1}$$

$\lambda = 0.150 \cdot 10^{-9} \text{ hr}^{-1}$ or 0.150 FIT; $MTTF = (1/\lambda) = 6,649.6 \text{ million hrs} = 759,089 \text{ years}$

The calculation shows failure rate is 0.150 FIT, MTTF is 6,649.6 million hours under typical operating conditions.

The qualification test results confirm that AOZ5311NQL passes AOS quality and reliability requirements for product manufacturing release.
